Tables S1 to S2

SI References

**Fig. S1.** Cumulative diseased plotted against number of days after  $Y(t)/Y_{max} > 0.005$ , comparing an SIRD with a Gompertz model. Both models are fit using non-linear least squares according to equations 1 and 12 in the text. Fitting is done with Python-Scipy and a 6-day windowed average of deaths. Observations are taken from the Github repository compiled by the Center for Systems Science and Engineering (CSSE) at Johns Hopkins University, Baltimore, USA (1).

**Table S1. Estimated values for the SIRD model fitted to various countries' observations as shown in Figure 1 using notation from eq. (12). Standard deviation estimates is given in the paranthesis corresponding to the last significant digit of the reported number.**

	$\eta \times 10^{-1}$	$\xi \times 10^4$	$\kappa \times 10^2$
Belgium	94(8)	3.2(2)	9.3(7)
Portugal	6.6(4)	35(2)	4.5(3)
Austria	8(1)	36(5)	11(1)
Switzerland	22(1)	13.6(7)	11.0(5)
